COMP150 - Evaluation

1507516

June 6, 2016

1 Introduction

This is a reflective report that proposes three main weaknesses that occurred during the second semester projects, then suggest how these issues could be overcome for future projects. My three weakest key skills are communication in group projects, discipline and requesting support from peers and tutors. These are all skills that need to be improved for second year projects.

2 Weakest Key Skills

2.1 Weakness One: Communication in Group Projects

In semester two we had a large group project that was to make a desktop game. This was the first time I have been working on a game collaboratively and I felt that I did not communicate with my team often enough, which impacted the amount and quality of the work that was produced.

Communication is vital to being an effective team in group projects, however in our group project there was almost no communication for the first 2

months of the project, and only in the last week of the project did we start communicating.

I feel this was mainly due to me and our group not following the scrum methodology enough.

To overcome this weakness, I am planning a summer games project with some friends back home, in which I will follow scrum closely and participate in the daily stand up meetings. Furthermore this will help me get more use to daily communication which was missing from my last group project.

2.2 Weakness Two: Discipline

Often I find it hard to motivate myself to work, especially when the task at hand can seem very daunting. I will tend to put it off and work on something I enjoy, instead of getting frustrated with something I don't yet understand.

For example, I struggled with trying to get `std::vector` to store values of the neighboring cells in the group game project, thus this demotivated me a lot to work on the group project as I felt I was unable to do it.

To overcome this, I aim to complete the book Design Patterns by Vlissides, John, et al before August, furthermore I will also try to implement some of the more complex design patterns into our comp150 game project, as to become more familiar with OOP.

2.3 Weakness Three: Requesting Support from Peers and Tutors

In one of my projects, I was stuck on one element of the game for a while, and was determined to try and do it myself. However I feel this is a bad approach to take as it wastes a lot of time when someone else can help you understand the problem much quicker.

This could of easily been avoided if I asked my team or my tutors for help

with this problem early on, instead of spending a few weeks trying to work it out myself.

To try and resolve this problem in future projects, over the course of the summer and the first semester next year I will attempt to communicate my issues when I know I am stuck on a problem. Furthermore this will hopefully be resolved when I follow scrum more closely and communicate my issues with the scrum master.

3 Conclusion

In conclusion, over the summer I will attempt to improve my communication and requesting support by working a group game project that will follow agile closely, and Discipline by the continuation of features to the comp150 game project that will make more effective use of OOP.
